CLEO · AI GUIDES

AI for Teachers

The AI tools that save you hours on lesson planning, differentiation, grading feedback, and parent communication — with exact step-by-step exercises.

ChatGPT · MagicSchool.ai · Diffit · Claude · Curipod · Parent Comms

Version 1.0 · March 2026 · Not for redistribution

CONTENTS

What's Inside

Six tools, covered in depth. Every exercise includes exact steps — which button to click, what to type, what to expect. Open your laptop alongside this guide and follow along.

01 **ChatGPT for Lesson Planning**
Write the perfect lesson planning prompt and get a full, structured plan in under 2 minutes

02 **MagicSchool.ai**
The Riff generator, differentiation tool, and rubric maker — with exact click-by-click exercises

03 **Diffit**
Adapt any text to any reading level in seconds — how to use it for every student

04 **Claude for Grading Assistance**
Prompt templates for written feedback that sounds like you — not a robot

05 **Quiz Generation**
ChatGPT and Curipod for instant quizzes, exit tickets, and interactive polls

06 **Parent Communication Drafts**
AI-drafted emails and updates that save the end-of-week scramble

07 **Your AI Teaching Week**
A suggested workflow integrating all six tools without adding to your workload

INTRODUCTION

AI Won't Replace You. It Will Give You Your Evenings Back.

Teachers spend an average of 3–4 hours per week on lesson planning, differentiation, and written feedback — on top of everything else. AI doesn't change what great teaching looks like. It changes how long the admin around it takes.

This guide covers six tools that are already being used in classrooms around the world. Not for gimmicks — for the real, repetitive, time-consuming tasks: writing a lesson plan from scratch, adapting a text for a struggling reader, writing personalised feedback on 30 essays, drafting the weekly parent newsletter.

Every tool has a free tier. Every exercise is step-by-step. And every prompt template in this guide has been tested and refined — not generated once and pasted in.

How to use this guide

- Pick one tool to start with. Don't try all six in the same week.
- Use your actual lesson content for the exercises — the results are immediately useful.
- The prompt templates are starting points. Adapt the language so it sounds like you.
- AI output always needs your judgement. Read what it produces before using it.

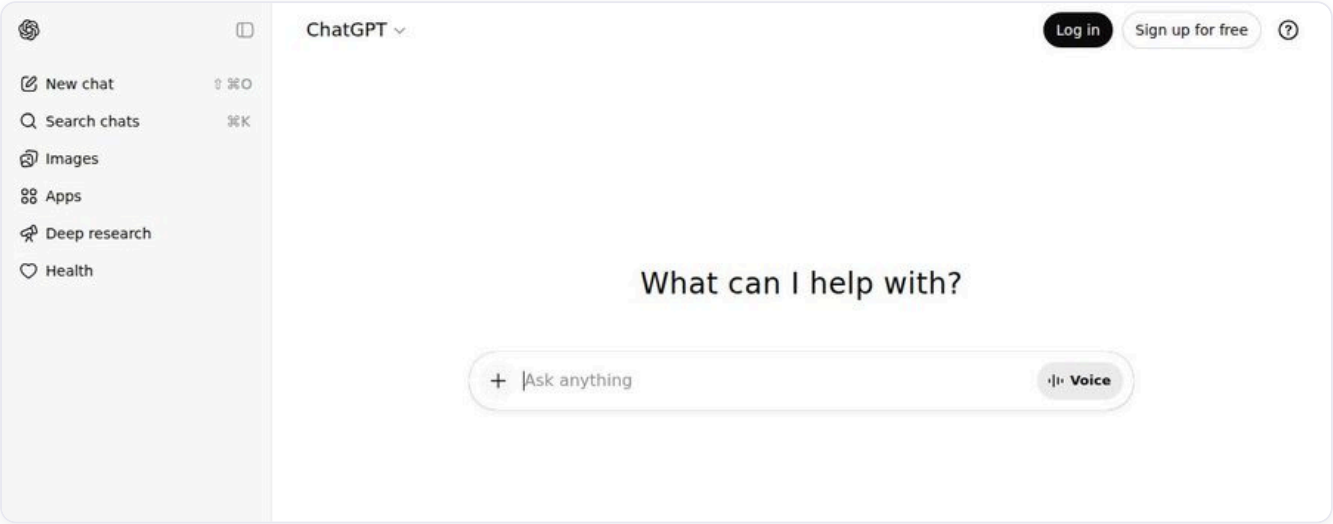
01 LESSON PLANNING

ChatGPT for Lesson Planning

Write the right prompt and get a full, structured lesson plan in under 2 minutes

Free · Plus plan $20/month for GPT-4o chat.openai.com



ChatGPT at chat.openai.com — type your lesson planning prompt in the message box at the bottom. GPT-4o (free tier) handles complex lesson structures well.

Most teachers who try ChatGPT for lesson planning get mediocre results — because they ask a vague question and get a vague answer. The difference between "write a lesson plan about fractions" and a prompt that includes your year group, prior knowledge, learning objectives, and timing constraints is enormous. This section shows you exactly what to include.

The anatomy of a great lesson planning prompt

- → **Year group and subject level.** Specify Key Stage, Year group, or grade level so ChatGPT calibrates its language and complexity appropriately.
- → **Prior knowledge.** Tell it what students already know. "They've covered equivalent fractions but haven't encountered improper fractions yet." This prevents ChatGPT from suggesting activities that assume knowledge students don't have.
- → **Learning objective(s).** One or two clear, specific objectives. Not "understand fractions" — "be able to convert improper fractions to mixed numbers and explain the method."
- → **Lesson duration and structure preference.** "50-minute lesson, I prefer starter-activity-main-plenary structure." ChatGPT will time each section.
- → **Differentiation needs.** Mention if you need support and extension built in — even briefly.

LESSON PLANNING PROMPT TEMPLATE

```
Create a detailed lesson plan for the following: - Subject: [SUBJECT] - Year Group:
[YEAR/GRADE] - Topic: [SPECIFIC TOPIC] - Prior knowledge: [WHAT THEY ALREADY KNOW] -
Learning objective: By the end of the lesson, students will be able to [OBJECTIVE] - Lesson
```

```
duration: [X] minutes - Structure: starter (5–10 min), main activity (25–30 min),
consolidation (10 min), plenary (5 min) - Differentiation: include one support suggestion
and one extension activity - Resources: assume only whiteboard, printed worksheets, and
basic stationery available Format the plan with timings for each section. Include the key
questions I should ask students during the main activity.
```

⚡ Try This — Step-by-Step Exercises

1 Generate your first full lesson plan in 2 minutes

1. Open **chat.openai.com** and sign in (or create a free account).
2. Copy the prompt template above. Fill in every [PLACEHOLDER] with your actual lesson details — don't leave any blank.
3. Paste the completed prompt into the message box and press Enter.
4. Read the output in full. Note: the timings, the key questions, the differentiation suggestions.
5. Identify anything that doesn't fit your class — change the timing on an activity, swap a resource, adjust the language level. Type "Adjust the main activity to be 5 minutes shorter and add a paired discussion element" to refine it in one follow-up message.

2 Create a week of lesson plans from a single prompt

1. After generating one lesson, type: "Now create a 5-lesson sequence for this topic, each 50 minutes, showing progression from [OBJECTIVE 1] to [OBJECTIVE 5]. Use the same format."
2. ChatGPT will output the full week. Review each lesson for logical progression — does Lesson 3 build on Lesson 2's knowledge?
3. Type "Lesson 3 assumes too much prior knowledge — simplify the main activity for mixed-ability Year 8" to refine any lesson that needs adjusting.
4. Copy the final sequence into a Google Doc or your planning tool.

3 Generate discussion questions for any text or topic

1. Paste in a text, poem, or passage you're using in class. Type: "Generate 8 discussion questions about this text for Year 9 students. Include 3 retrieval questions, 3 inference questions, and 2 evaluative questions. Label each type."
2. Review the questions — remove any that are ambiguous or beyond your class's level.
3. Ask ChatGPT to "write suggested model answers for each question, in the style a Year 9 student might produce."
4. Use these as your marking guide or to brief a teaching assistant.

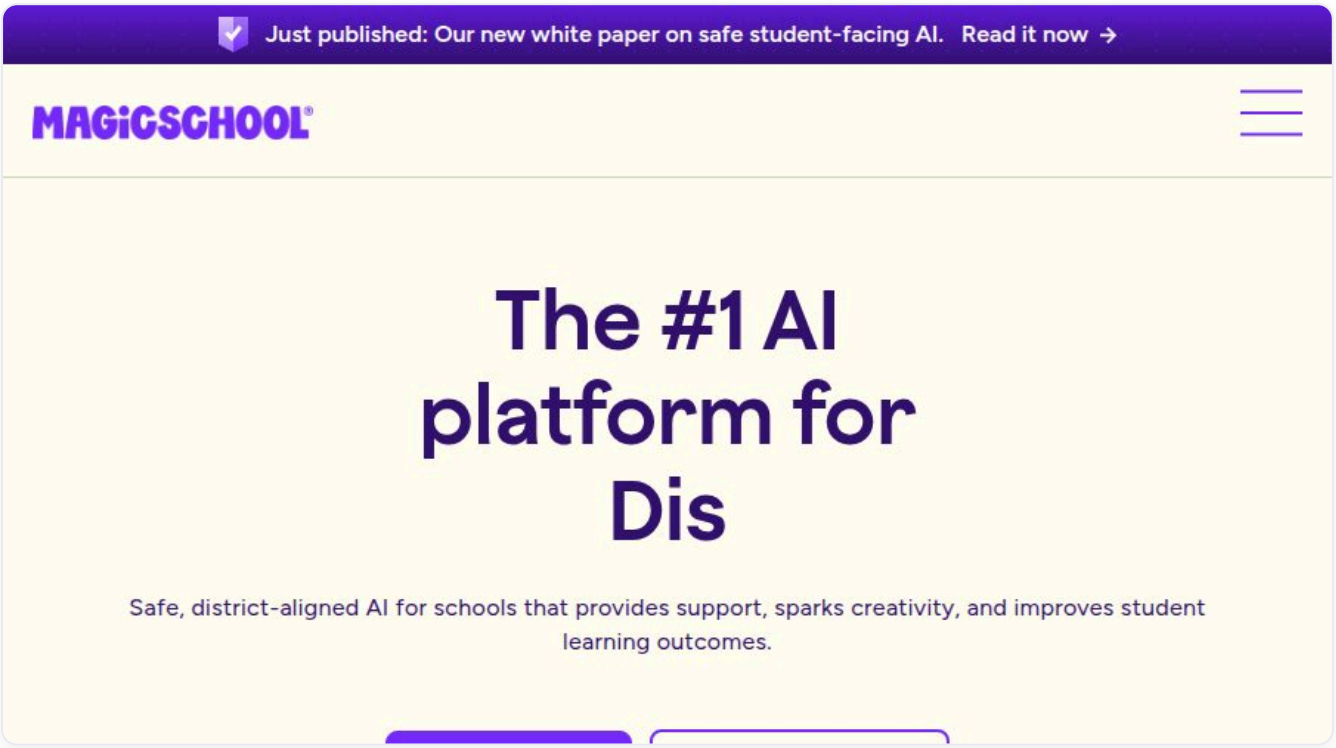
Bottom line: The free tier is sufficient for almost all lesson planning tasks. The key is the prompt — a well-structured prompt takes 3 minutes to write and saves 30–40 minutes of planning. Use it for every lesson you plan this week and adjust the template to fit your style.

02 AI TEACHING PLATFORM

MagicSchool.ai

60+ purpose-built tools for teachers — lesson planning, differentiation, rubrics, and more

Free · Plus plan $12/month magicschool.ai



MagicSchool.ai — the dashboard shows all 60+ tools. The most useful for most teachers are under "Lesson Planning", "Differentiation", and "Assessment".

MagicSchool.ai is built specifically for education. Unlike using ChatGPT raw, every tool here already has the right context built in — you're not writing prompts from scratch, you're filling in a structured form designed by educators. It's faster and more reliable for classroom-specific tasks.

The three tools worth starting with

→ **Riff (Lesson Plan Generator).** MagicSchool's version of lesson planning — fill in the subject, grade, topic, and objectives and get a structured plan with differentiation built in. More classroom-ready than raw ChatGPT output because the form guides you to include the right context.

→ **Differentiation Helper.** Paste in any existing activity or text and specify your target student profile (reading level, EAL, SEND support needs). It rewrites the content to match — without you having to craft the prompt yourself.

→ **Rubric Generator.** Describe the task and grading criteria and it produces a detailed rubric you can use directly. Adjust the number of levels and descriptors before downloading.

⚡ Try This — Step-by-Step Exercises

1 Use the Riff generator to build a lesson plan

1. Go to **app.magicschool.ai** and create a free account (takes 60 seconds — use your school email).
2. On the dashboard, find **"Riff"** under Lesson Planning or use the search bar at the top and type "Riff".
3. Click **Riff**. A structured form appears. Fill in: **Grade Level**, **Subject**, **Topic**, **Learning Objectives** (one or two), **Duration**.
4. Click **Generate**. In about 10 seconds, a full lesson plan appears — with activities, timing, and differentiation notes.
5. Review the plan. Click **"Regenerate"** to get a different version, or manually edit any section directly in the output box.
6. Click **Copy** to paste the plan into your planning document, or use **Export to Google Doc** if that option is available on your plan.

2 Differentiate an activity for a struggling reader

1. From the dashboard, search for **"Differentiation Helper"** and click it.
2. In the **"Original Content"** box, paste a paragraph from a worksheet, textbook, or reading passage you're using this week.
3. In the **"Student Needs"** field, describe your target student: "Year 6 student reading at Year 3 level, EAL, better with shorter sentences and visual cues."
4. Click **Generate**. MagicSchool rewrites the content to match — simpler vocabulary, shorter sentences, same core information.
5. Compare the original and adapted versions. Check the meaning hasn't been lost. Copy the adapted version into your worksheet.

---

3 Generate a grading rubric in 60 seconds

1. Search for **"Rubric Generator"** and click it.
2. Enter the **Task Description** (e.g. "Persuasive essay arguing for or against school uniform, 400–600 words, Year 8").
3. Enter the **Grading Criteria** you want to assess: e.g. "Argument structure, use of evidence, vocabulary, accuracy of grammar and punctuation, engagement of the reader."
4. Select **4 performance levels** (or however many you use).
5. Click **Generate**. Review each descriptor — edit any that use language students won't understand or that describe the wrong standard for your class.
6. Print or share the rubric with students before they begin the task.

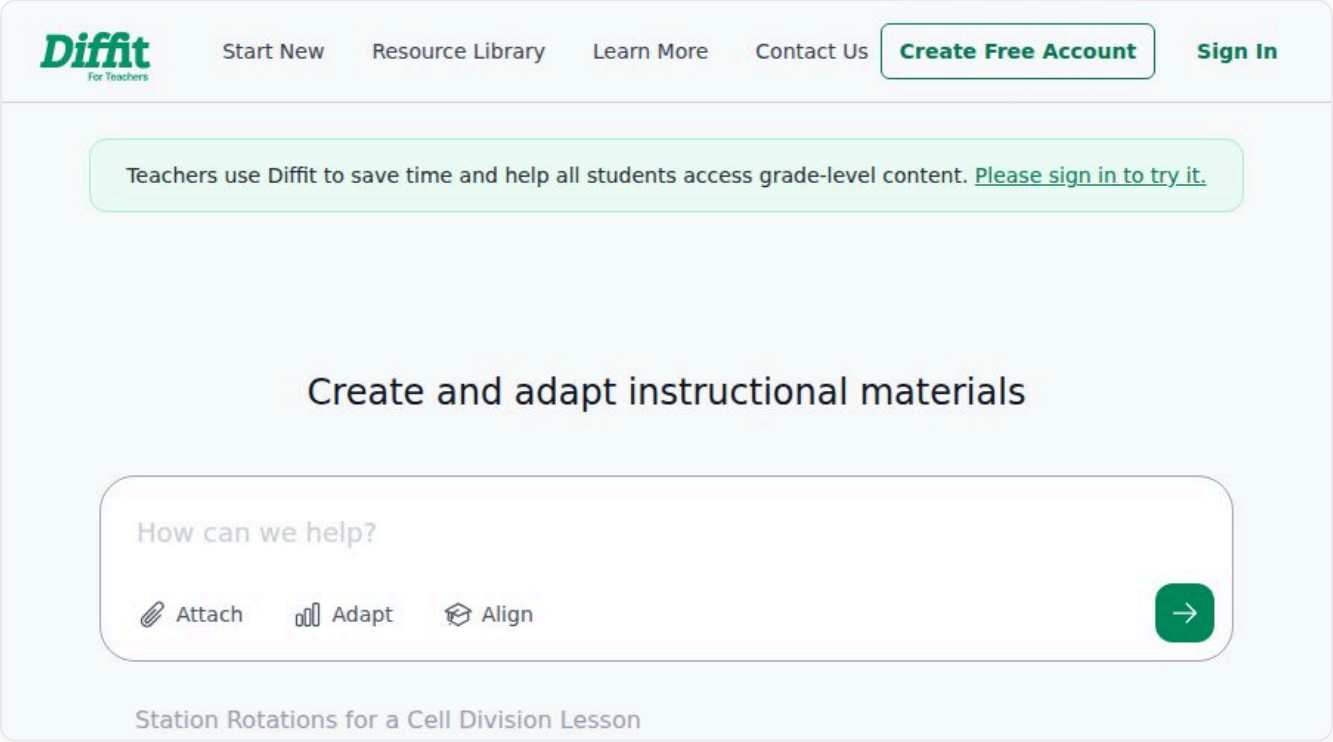
Bottom line: MagicSchool is the fastest route to classroom-ready output. The form-based approach removes the need to write complex prompts and produces more directly usable results than raw ChatGPT for most day-to-day teaching tasks. Start with free — it covers everything in this guide.

03 DIFFERENTIATION

Diffit

Adapt any text, article, or topic to any reading level — instantly

Free tier · Pro $12/month diffit.me



Diffit — enter a topic, URL, or paste text, then select a reading level. The adapted text, vocabulary list, and comprehension questions generate in seconds.

Diffit does one thing exceptionally well: it takes any text, URL, topic, or document and adapts it to the reading level you specify. It also generates comprehension questions, a vocabulary list, and a summary for students — all at the right level. For teachers with mixed-ability classes, it transforms differentiation from a 40-minute task into a 2-minute one.

What Diffit generates for any input

- → **Adapted text.** Rewritten at your target reading level — simpler vocabulary, shorter sentences, same core content. You can generate the same text at three different levels simultaneously for grouped reading.
- → **Comprehension questions.** Multiple-choice and open-ended questions about the adapted text. Diffit calibrates the question difficulty to match the reading level.
- → **Vocabulary list.** Key subject-specific terms extracted from the text with definitions at the appropriate level — useful for pre-teaching vocabulary before reading.
- → **Student-facing summary.** A short, age-appropriate summary students can use to check understanding before answering questions.

⚡ Try This — Step-by-Step Exercises

1 Adapt a topic for multiple reading levels in 3 minutes

1. Go to **diffit.me** and sign in with Google (free account — takes 30 seconds).
2. On the main screen, select **"Topic"** from the input options at the top.
3. Type a topic you're covering this week — e.g. "The causes of World War One" or "Photosynthesis in plants."
4. Select your target reading level from the dropdown — start with **Grade 4** (roughly Year 4–5 reading level) for your support group.
5. Click **Generate**. In about 15 seconds, Diffit produces: adapted text, vocabulary list, comprehension questions, and summary.
6. Go back and generate the same topic again at **Grade 7** for your on-level group, and **Grade 10** for extension. You now have three differentiated materials for the same lesson, generated in under 5 minutes total.

---

2 Adapt an existing article or webpage

1. Find a BBC News article, Wikipedia page, or news source relevant to your topic. Copy the URL.
2. On Diffit, select **"URL"** from the input options. Paste the URL into the field.
3. Select your target reading level and click **Generate**.
4. Diffit extracts the article text and adapts it — same facts, accessible language. Review the output to ensure it's captured the key information accurately (AI occasionally misses a detail on complex topics — always check).
5. Click **Assign to Students** or **Export** to download as a PDF or Google Doc.

---

3 Use the vocabulary list for pre-teaching

1. Generate a topic resource at your target level as above.
2. Scroll down to the **Vocabulary** section. You'll see 8–12 subject-specific terms with definitions.
3. Before the reading activity, display these terms on your board and spend 5 minutes pre-teaching: "Who knows what this means? Can anyone use it in a sentence?"
4. Students then encounter familiar terms when they read — comprehension improves significantly for EAL and struggling readers.
5. Tip: save the vocabulary list as a word bank students can refer to during independent work.

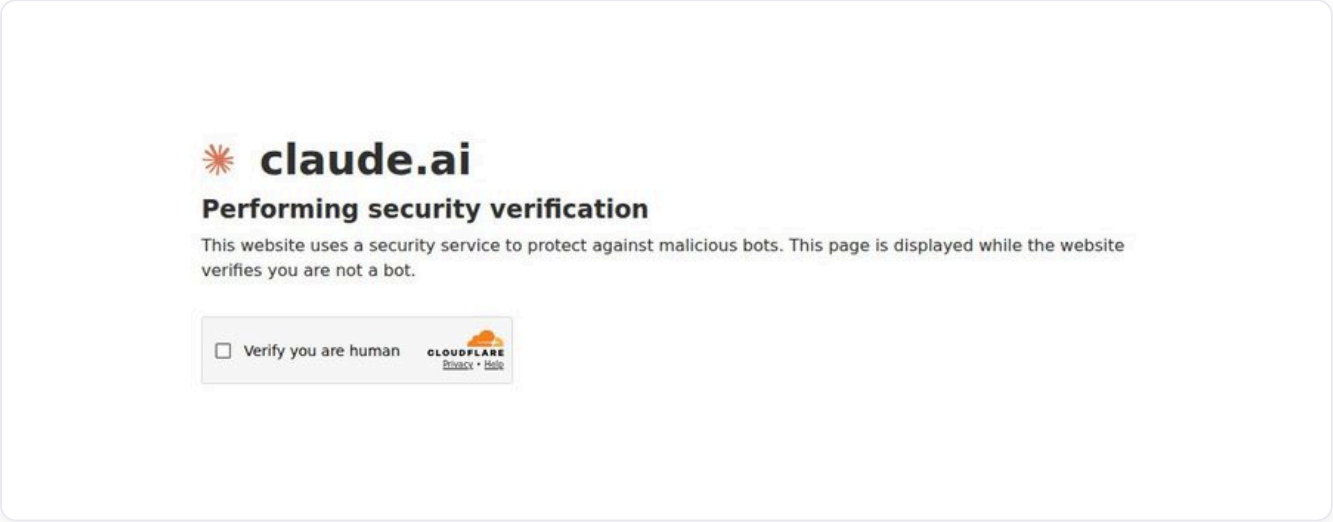
Bottom line: Diffit is the most useful differentiation tool available to teachers right now. The free tier generates adapted materials for any topic — the main limitation is the number of exports per month. Use it for your most time-consuming differentiation tasks first.

04 ASSESSMENT & FEEDBACK

Claude for Grading Assistance

AI-drafted feedback that sounds personal — and saves 2 minutes per essay

Free tier · Pro $20/month claude.ai



Claude at claude.ai — better than ChatGPT for nuanced written feedback because it writes with more natural variation. Paste student work and your rubric criteria to get started.

There is a right way and a wrong way to use AI for grading. The wrong way: paste a student's essay and ask "what grade does this deserve?" AI makes grading decisions unreliably — assessment judgement is yours. The right way: use AI to draft the written feedback comment, then review and edit it. This is where it genuinely saves time — and why Claude (which tends to write with more natural variation than ChatGPT) is the better tool for this task.

What Claude is good at — and what it isn't

→ **Good at:** Drafting personalised-sounding feedback comments. Generating sentence starters for written feedback. Summarising strengths and areas for development from bullet points you provide. Writing next-steps in student-accessible language.

→ **Not reliable for:** Making the grading decision (that's yours). Assessing whether the student's facts are correct. Producing feedback that doesn't need to be read before sending — always read every output.

GRADING FEEDBACK PROMPT TEMPLATE

```
I'm a [SUBJECT] teacher marking [YEAR GROUP] work. I'm going to give you the key points
I've identified for one student, and I want you to draft a written feedback comment. My
feedback notes for this student: - Strengths: [LIST 2–3 THINGS THE STUDENT DID WELL] -
Areas to develop: [LIST 1–2 THINGS TO IMPROVE] - Grade/level awarded: [GRADE – you're not
deciding this, just including it for context] Write a 60–80 word feedback comment in the
second person ("You have..."). Use encouraging language. Be specific about what was done
```

```
well, not just "good work." End with one clear next step. Don't use generic phrases like
"well done" or "try harder." Sound like a thoughtful, direct teacher, not an AI.
```

⚡ Try This — Step-by-Step Exercises

1 Draft feedback for a piece of work you've already marked

1. Open
   claude.ai
   and sign in (free account — use Google sign-in).
2. Take a piece of student work you've already graded this week. You know what to say — you just haven't written it yet.
3. Copy the feedback prompt template above. Fill in: your subject, year group, the 2–3 strengths you noted, the 1–2 development points, and the grade.
4. Paste it into Claude and press Enter. Read the output carefully. Does it sound like feedback you'd write? Is anything inaccurate about the student's work?
5. Edit 2–3 phrases to match your voice and the student's specific work. This takes 30 seconds rather than 2–3 minutes from scratch. Repeat for the next student — keeping the template, changing the bullet points.

---

2 Generate WWW/EBI comment starters for your whole class

1. After marking a class set, you often notice 3–4 common strengths and 3–4 common development areas. Type these into Claude:
2. "I've just marked 28 Year 9 essays on [TOPIC]. Common strengths: [LIST]. Common development areas: [LIST]. Write 6 sentence starters for 'What Went Well' comments and 6 for 'Even Better If' comments that I can adapt for individual students."
3. Claude produces a bank of varied sentence starters. Copy these into a document as your marking toolkit for this task — adapt 2–3 for each student rather than writing from scratch.
4. This approach means each student's feedback uses different language (so it doesn't look like you used a template), while you're doing a fraction of the writing.

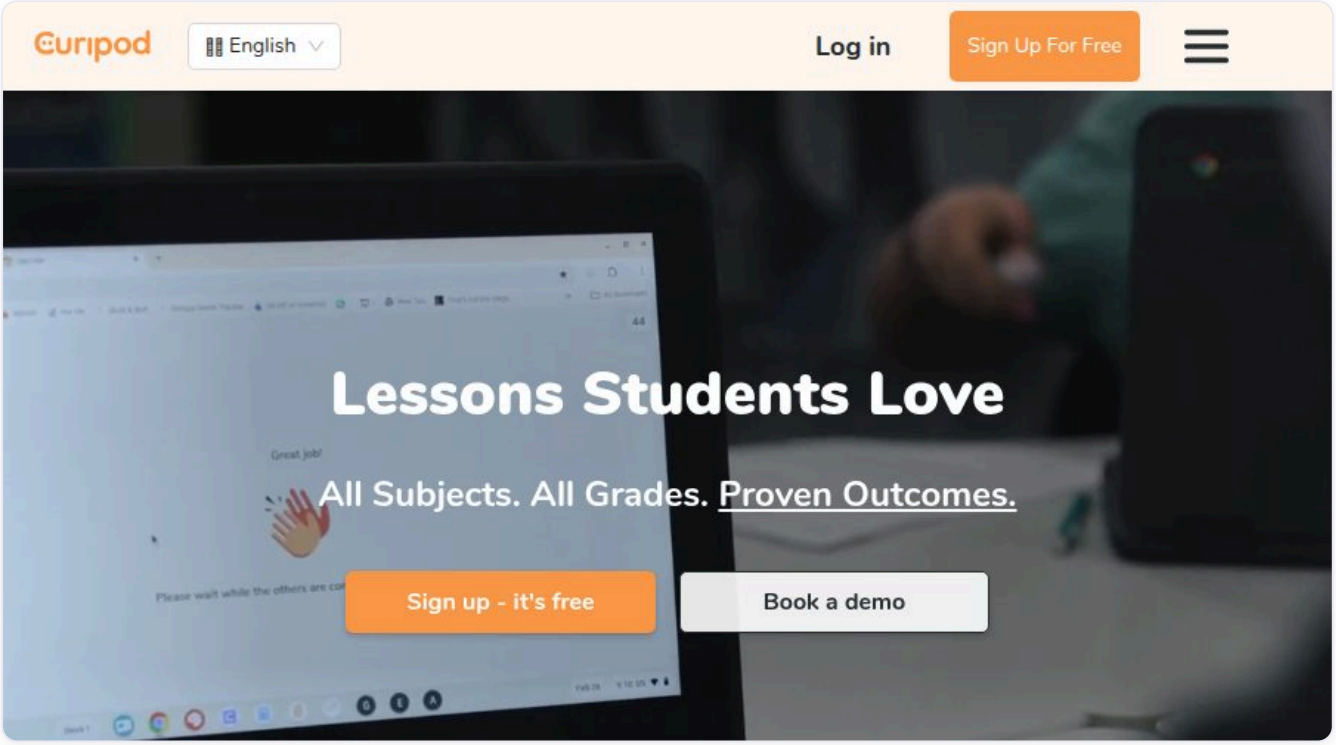
Bottom line: Using Claude for grading assistance typically saves 90 seconds to 2 minutes per piece of feedback. On a class set of 28, that's 45–55 minutes. The key rule: you provide the substance, AI provides the words. Never use AI output without reading and editing it.

05 ASSESSMENT

Quiz Generation with ChatGPT & Curipod

Exit tickets, formative quizzes, and interactive polls — created in under 3 minutes

Free · Curipod Plus $10/month curipod.com · chat.openai.com



Curipod — type a topic and get an interactive lesson with AI-generated slides, polls, and open-ended questions your students can respond to live on their devices.

Quiz generation is one of the clearest wins for AI in the classroom. ChatGPT generates question sets on any topic in seconds — differentiated by difficulty, formatted for printing, with answers included. Curipod goes further: it creates interactive classroom activities students participate in live on their phones, with no app download required.

Two tools, two use cases

→ **ChatGPT for printed quizzes and exit tickets.** Fast, flexible, easy to format. Best when you need questions to hand out on paper or display on a board.

→ **Curipod for live interactive sessions.** Students respond on devices in real time. Great for checking understanding at the end of a lesson or for revision. Works on any browser — no app needed.

⚡ Try This — Step-by-Step Exercises

1 Generate a 10-question exit ticket with ChatGPT

1. Open **chat.openai.com**. Type the following prompt, filling in the placeholders:
2. "Create a 10-question exit ticket for [SUBJECT], [YEAR GROUP], on the topic of [TOPIC]. Include: 4 multiple-choice questions (4 options each), 3 short-answer questions requiring one sentence, and 3 true/false questions. Difficulty: [easy/medium/hard]. Include an answer key at the end. Format for easy printing."
3. Review the questions. Remove any that are ambiguous or that assume knowledge students don't have yet.
4. Ask ChatGPT to "rewrite question 4 to be clearer — students might confuse [X with Y]."
5. Copy the final quiz into a Word document or Google Doc and format for your class. Print or display on the board for the final 10 minutes of the lesson.

---

2 Create an interactive Curipod lesson for revision

1. Go to **curipod.com** and create a free account.
2. Click **"Create with AI"** or **"New lesson"** (the interface may vary slightly — look for the AI generation option).
3. Type your topic and year group into the prompt field: "A revision lesson on [TOPIC] for Year [X] [SUBJECT]. Include a mix of multiple-choice, open-ended questions, and one poll slide asking students how confident they feel."
4. Click **Generate**. Curipod creates a full interactive lesson — typically 8–12 slides with different question types.
5. Review each slide. Edit any question that needs adjusting — click directly on the text to edit. Remove slides that don't fit your learning objectives.
6. Click **Present** to go live. Students join by going to **curipod.com** on their device and entering the room code. Responses appear on your screen in real time.

---

3 Generate revision questions from your own notes or textbook

1. Paste a section of your teaching notes, a textbook passage, or a revision summary into ChatGPT.
2. Type: "Based only on the information I've just given you, create 8 exam-style questions a student could use to test themselves. Include questions that require recall, application, and evaluation. Don't include any questions about content I haven't mentioned. Include mark-scheme style answers."
3. The questions will be directly tied to your material — no risk of ChatGPT bringing in content from outside your curriculum.
4. Share the questions with students as a self-quizzing resource, or use them as a live class activity.

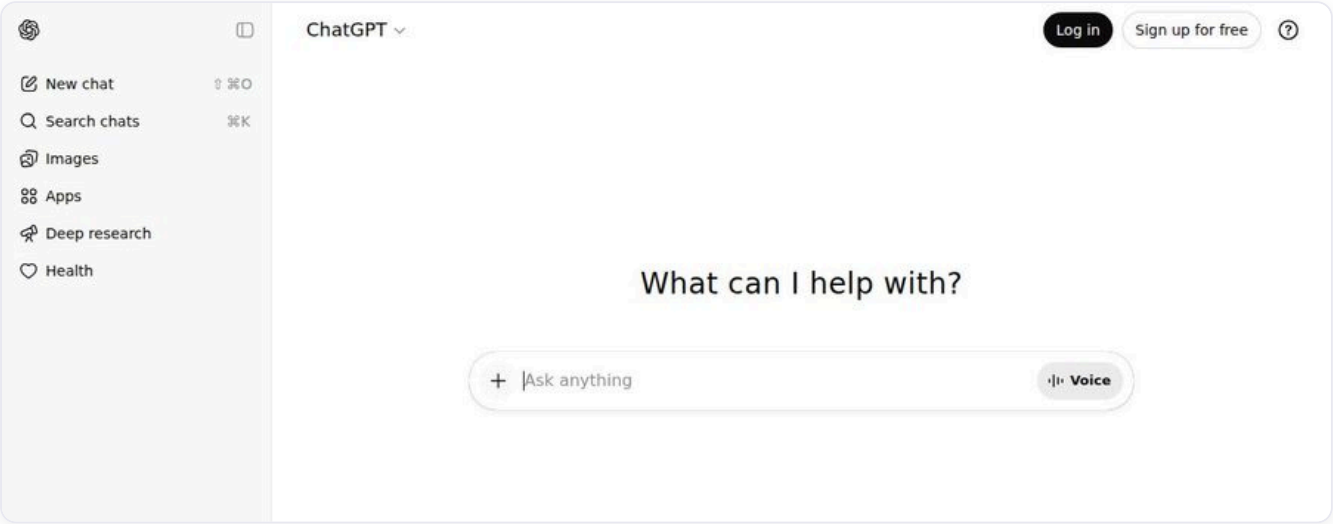
Bottom line: ChatGPT for quiz generation is a near-perfect time saver — what takes 30 minutes to create manually takes 3 minutes with AI. Always check the questions for accuracy and age-appropriateness. Curipod adds the live interactive element that makes revision genuinely engaging.

06 COMMUNICATION

Parent Communication Drafts

AI-drafted emails, newsletters, and updates that save the end-of-week scramble

Free with ChatGPT or Claude chat.openai.com · claude.ai



Use ChatGPT or Claude for drafting parent communications — both handle tone well. Claude tends to write more naturally for sensitive conversations.

Parent communication is time-consuming and emotionally taxing — particularly when you're writing about a student who's struggling, dealing with a difficult situation, or trying to frame a concern constructively. AI drafts the first version in seconds. You review, personalise, and send. The emotional labour is still yours — the typing isn't.

When to use AI for parent communication

- **Weekly newsletters and updates.** "This week we covered X. Students are working on Y. Please encourage them to do Z at home." These follow a template — AI produces them in 30 seconds once you tell it the content.
- **Positive achievement emails.** Quick, warm notes to parents about a student's progress. AI writes the structure; you add the specific detail that makes it feel personal.
- **Concern emails (first drafts only).** If a student's performance or behaviour is a concern, AI drafts the factual, professional language. You always review, check with your SENCO or line manager where appropriate, and edit to match your school's approach.
- **Meeting prep summaries.** A brief summary of the key points you want to raise in a parents' evening appointment — useful as a prompt card for the meeting.

PARENT EMAIL PROMPT TEMPLATES

```
POSITIVE ACHIEVEMENT EMAIL: Draft a short, warm email to a parent from a [SUBJECT] teacher
at a secondary school. The student [STUDENT NAME – optional] has shown [DESCRIBE WHAT
THEY'VE DONE WELL]. The tone should be genuine and specific, not generic. Length: 4–5
sentences. Start with "I wanted to take a moment to share..." Do not use the phrase "I hope
```

```
this email finds you well." WEEKLY CLASS UPDATE: Write a brief weekly update for parents of
my [YEAR GROUP] [SUBJECT] class. This week we covered: [LIST TOPICS]. Next week we will be:
[UPCOMING]. Students should spend 10–15 minutes on [HOMEWORK/REVISION TASK]. Please ask
them about [SPECIFIC THING TO DISCUSS AT HOME]. Keep it under 120 words. Friendly, clear
tone. CONCERN EMAIL (first draft only — always review with your line manager): Draft a
professional, factual email from a teacher to a parent expressing concern about [BRIEF
DESCRIPTION OF CONCERN]. Stick to observable facts, avoid speculation, use neutral
language. Suggest a short meeting. Do not sound accusatory. Length: 100–120 words.
```

⚡ Try This — Step-by-Step Exercises

1 Write a week's worth of parent communication in 20 minutes

1. Open **claude.ai** or **chat.openai.com**.
2. Think about the 3–4 types of communication you typically send this week: a class update, one or two positive notes, possibly a concern email.
3. Start with the class newsletter. Use the "Weekly Class Update" template above, filled in with this week's actual content. Read the output — it usually needs 1–2 tweaks to sound like you.
4. Then generate each positive achievement email using the template. Add the student's specific name and what they actually did — one personalising detail makes the whole email feel genuine.
5. For any concern emails: draft using the template, then read it carefully for tone before sending. Share with your SENCO or line manager if the situation warrants it.

---

2 Prepare for parents' evening with AI

1. For each parents' evening appointment, type the following into Claude: "I'm about to have a 5-minute parents' evening appointment for a Year [X] [SUBJECT] student. Key points I want to cover: [LIST 3–4 BULLET POINTS — strengths, areas for development, specific actions for home]. Write a structured talking-points card I can use to keep the conversation on track."
2. Claude produces a short, organised prompt card. Print one for each appointment — 30 seconds per student rather than 5 minutes of note-making.
3. Use the talking points card to open each conversation, then let it run naturally. Having the structure prepared means you cover every important point even in a 5-minute slot.

Bottom line: AI for parent communication saves time on the mechanical writing. The relationship, judgement, and sensitivity are yours. Never send an AI-drafted email — particularly about a concern — without reading it carefully and making it your own. Use it as a first draft, not a finished product.

PUTTING IT ALL TOGETHER

Your AI Teaching Week

A suggested workflow for integrating all six tools without adding to your existing workload — the goal is to replace time-consuming manual tasks, not to add new ones.

01

MONDAY PLANNING

Lesson plans for the week — 20 minutes instead of 90

Open ChatGPT or MagicSchool Riff. Use your scheme of work topics for the week and generate draft lesson plans for each. Review and edit each one — budget 5 minutes per lesson rather than 20. Save the final versions to your planning document.

02

BEFORE EACH LESSON

Differentiated materials — 3 minutes per group

If you have a lesson with mixed-ability groups or students needing support, open Diffit. Type the topic or paste the text you're using. Generate at two or three reading levels. Download and print. Done.

03

END OF LESSONS

Exit tickets and formative checks — 3 minutes

Use ChatGPT to generate a quick exit ticket the night before (10 questions, answer key included). Or use Curipod to run a live interactive check in the last 8 minutes of class — students respond on their phones, you see results instantly.

04

MARKING EVENINGS

Written feedback — 90 seconds per student

Mark the work as normal (your judgement is irreplaceable). For each piece, note 2 strengths and 1 development point in bullet form. Then paste into Claude with the feedback template. Edit the output for 30 seconds to match your voice. Move on.

05

FRIDAY

Parent communication batch — 20 minutes total

Generate the weekly class newsletter using the template. Draft any positive achievement emails. Write any concern emails (first drafts only — review carefully). Send. The entire week's parent communication, done before you leave school.

FINAL WORD

Teaching is still a human job. AI just handles more of the paperwork.

Every tool in this guide is a time-saver, not a replacement. The relationship with your students — the moment when something clicks, the conversation that changes someone's direction, the feedback that arrives at exactly the right time — none of that is in here. That's yours.

What is in here: the 90 minutes of lesson planning you do every Sunday evening. The 45 minutes of marking commentary that's really just finding different ways to say the same things. The parent newsletter that goes out late because you didn't have time to write it earlier in the week.

Pick one tool from this guide this week. Use it for one real task. See how much time it takes. If it saves you 20 minutes and the output is good enough to use with minor edits — that's the whole argument made.

The teachers using AI most effectively aren't the ones doing everything differently. They're the ones who identified three specific things that were eating their time and replaced them with a 3-minute prompt.

Stay ahead with Cleo

Cleo publishes practical AI guides for real people in real jobs.
